

Abstract No 4

Title: Fluid and Waste Management

Description of the presentation:

Water used for drilling fluids and hydro excavation is key for effective utility installation, but proper disposal can add significant operational costs and logistical challenges for contractors. That's why the right equipment and a good plan are key.

When planning your next job's disposal, there are many things you should consider. During this presentation, we will highlight an industry solution that helps allow contractors to control the cost, time and complexity of drilling fluid and hydro-excavation waste management and explain why it could be a good option for a variety of utility installation situations.
